

CEGIS-Foundation

GitHub Organisation — Team & Repository Guidelines

A quick guide for all contributors on using teams, roles, and repositories under the CEGIS-Foundation GitHub organisation.

1. Why a GitHub Organisation?

Until now, team members have been managing project repositories under their personal GitHub accounts. This worked for individual projects but made it hard to:

- Find all CEGIS code in one place
- Control who has access to what
- Collaborate across teams without sharing personal credentials
- Maintain ownership of the code when someone leaves

The CEGIS-Foundation GitHub organisation solves all of this. It is a shared home for all CEGIS code repositories, owned and managed by the Tech Team with all the rights to individuals and teams who are working on them. In a nutshell, way of working doesn't change just the home of all code becomes consolidated.

2. How It Is Organised: Teams

Inside the organisation, repositories are grouped using Teams. A team represents a group of people working on a set of related projects (e.g., Tech Team, PM, SPF, ESU, SAM, OM etc).

The Tech Team will:

- Create teams and assign the right repositories to each team
- Add members to the appropriate team(s)
- Set team visibility (visible to all org members, or secret)
- Team members can create code repositories, manage the code and the ownership becomes organisational

Info

You will receive an email invitation to join the organisation and your team. Accept it to get access.

3. Team Roles - Maintainer vs Member

Every person added to a team has one of two roles. Here is what each role means:

Maintainer

The team admin. Usually the Tech Team lead or a designated project owner. Responsible for keeping the team well-managed.

- Can add or remove team members
- Can assign repositories to the team
- Can change team settings and description
- Has full access to all team repositories

Member

A regular contributor. Focuses on doing the actual work — writing code, raising pull requests, reviewing changes.

- Can push code, create branches, raise and review pull requests
- Has read/write access to all repositories assigned to their team
- Cannot change team settings or manage membership
- Cannot delete the repositories

Quick comparison:

Action / Permission	Maintainer	Member
Add / remove team members	✓	✗
Change team settings & visibility	✓	✗
Assign repos to the team	✓	✗
Push / commit code to assigned repos	✓	✓
Create branches, raise pull requests	✓	✓
Review & merge pull requests	✓	✓
Read private team repos	✓	✓

⚠ Note

If you are unsure which role you have, ask your team Maintainer or the Tech Team.

4. Transferring Your Personal Repo to the Organisation

If you have a project repository sitting in your personal GitHub account that belongs to CEGIS work, you should transfer it to the CEGIS-Foundation organisation. This ensures the code is safely owned by CEGIS and not tied to your personal account.

✓ Tip

Transferring a repo does not delete your code. Everything — commits, branches, issues, pull requests — moves over intact. GitHub also sets up automatic redirects from your old repo URL.

Steps to Transfer

Step 1: Go to your repository on GitHub

Open the repository you want to transfer at github.com/your-username/repo-name

Step 2: Open Settings

Click the "Settings" tab at the top of the repository page (you need to be the owner).

Step 3: Scroll to the Danger Zone

Scroll all the way down to the section labelled "Danger Zone" at the bottom of the Settings page.

Step 4: Click "Transfer"

Click the "Transfer" button next to "Transfer ownership."

Step 5: Enter the organisation name

In the dialog that appears, type: CEGIS-Foundation as the new owner.

Step 6: Confirm and submit

Type the repository name to confirm, then click "I understand, transfer this repository."

✓ Tip

After transfer, the Tech Team will assign the repo to your team so you continue to have access. Let the Tech Team know once you have transferred a repo.

5. Assigning a Repository to Your Team

Once a repository is inside the organisation, it needs to be assigned to the relevant team so team members can work on it. Only a Maintainer (or an Org Owner from the Tech Team) can do this.

Steps (for Maintainers)

Step 1: Go to the organisation

Visit github.com/CEGIS-Foundation and click on the "Teams" tab.

Step 2: Open your team

Click on your team name from the list.

Step 3: Go to Repositories tab

Inside your team page, click the "Repositories" tab.

Step 4: Add a repository

Click "Add repository" and search for the repo name (it must already be inside the CEGIS-Foundation organisation).

Step 5: Set the permission level

Choose the appropriate access level — Write for active contributors, Read for observers.

⚠ Note

If a repository you need access to has not been assigned to your team yet, contact your team Maintainer or the Tech Team.

6. Everyday Workflow

Once you are set up, your day-to-day GitHub usage stays largely the same:

- Clone repos from github.com/CEGIS-Foundation/repo-name instead of a personal URL
- Push your branches and raise pull requests as usual
- Tag your Maintainer or a teammate for code reviews
- Org-level repos follow the same Git conventions your team uses

i Info

Repositories inside the organisation are private by default. Only org members with the right team access can see them.

7. Quick Reference

I want to...	What to do
Join the organisation	Accept the email invitation sent by the Tech Team
Transfer my personal repo	See Section 4 — then notify the Tech Team
Get access to an org repo	Ask your team Maintainer to assign it to your team
Add a new member to my team	Maintainer: go to Teams → your team → Members → Invite
Change a member's role	Maintainer: go to Teams → your team → Members → change role
Create a new repo for a project	Contact the Tech Team — repos are created at org level
Report an access issue	Contact the Tech Team
